## Major comments

## 論文の概略 最終結果の理由

This is an article studying which factors have impact on food preference using dataset of CHNS among adults aged >=18 years-old Chinese residents living three different parts of China. Basically speaking, the authors must discuss why food preference is important on health first. Unless discussing this matter, the readers could not understand why this study's result is of importance on health policy-making or strategies. Moreover, [the results shown in this seems very similar and no novel findings could not drawn from this study as the authors also discussed in the discussion parts \(line 319-324\).](#)

新規性なし

Based on above mentioned aspects, I must conclude that this article could not be worth to be published in your journal. [The result of my reviewing this is reject.](#)

Reject

## Minor comments

## 表記の誤謬 図表の不適切な部分など

1. At the beginning of studies, sample size was 30,000 (line 118), that in result was decreased to 3940 because of missing key information. Among people who missed key information, I suppose important key information might be hidden. In my impression, these missing data might be taken in the other parts to discuss.
